[beige@mcpro-]~$
render -?

Usage: render [options] filename
       where "filename" is a Maya ASCII or a Maya binary file.

Common options:
  -help          Print help
  -test          Print Mel commands but do not execute them
  -verb          Print Mel commands before they are executed
  -keepMel       Keep the temporary Mel file
  -listRenderers List all available renderers
  -renderer string Use this specific renderer
  -r string      Same as -renderer
  -proj string   Use this Maya project to load the file
  -log string    Save output into the given file

Specific options for renderer "default": Use the renderer stored in the Maya file

General purpose flags:
  -rd path          Directory in which to store image file
  -of string        Output image file format. See the Render Settings window to
                   find available formats
  -im filename      Image file output name

Frame numbering options
  -s float          Starting frame for an animation sequence
  -e float          End frame for an animation sequence
  -b float          By frame (or step) for an animation sequence
  -pad int          Number of digits in the output image frame file name
                   extension
  -rfs int          Renumber Frame Start: number for the first image when
                   renumbering frames
  -rfb int          Renumber Frame By (or step) used for renumbering frames
  -fnc int          File Name Convention: any of name, name.ext, ... See the
  the              Render Settings window to find available options. Use namec and
                   namec.ext for Multi Frame Concatenated formats. As a shortcut,
                   numbers 1, 2, ... can also be used
```
